

# CuboidPilot & Cai AI

## Platform Architecture, Pricing & Integration Guide 2026

A product and technical guide to the CuboidPilot customer engagement platform and Cai AI Agent - covering the reference architecture, customer journey, AI grounding, workflow automation, integrations, security model, commercial plans, deployment, and implementation patterns.

**AI when it works. Humans when they matter.**

CuboidPilot connects Cai, website conversations, leads, WhatsApp continuity, payments, automation and Human Action in one continuous customer journey.

| EDITION     | Platform Guide • 2026                                |
| POSITIONING | Enterprise-grade AI + human customer action platform |

Prepared as a platform overview based on the public CuboidPilot/Cai product experience available in October 2026. Internal infrastructure details not publicly documented are represented as a recommended reference architecture, not asserted production implementation.

# Executive Overview

What CuboidPilot is designed to do and where Cai fits.

CuboidPilot is a customer engagement and conversion platform built around a hybrid operating model: Cai handles routine customer conversations and commercial qualification, while Human Action brings a team member into the same context when a high-value, complex or sensitive moment requires human judgment.

Cai AI Agent is positioned as the autonomous intelligence layer. It answers from approved business knowledge, detects intent, qualifies leads, prepares summaries, and supports action-oriented flows such as handoff, booking, payment and follow-up.

| <b>Experience</b>         | Website widget and omnichannel customer entry point          | Chat, cards, product/service recommendations, actions |
|---------------------------|--------------------------------------------------------------|-------------------------------------------------------|
| <b>Cai Intelligence</b>   | Grounded answers, intent classification and decision support | Answer, confidence, intent, recommended next action   |
| <b>Knowledge</b>          | Approved website, docs, FAQs, pricing, policies and catalogs | Retrievable verified business context                 |
| <b>CRM &amp; Pipeline</b> | Lead capture, qualification and lifecycle tracking           | Cold/Warm/High intent, owner, stage, value            |
| <b>Human Action</b>       | Escalation and takeover without losing context               | Cai summary + full conversation timeline              |
| <b>Automation</b>         | Company-configurable workflow orchestration                  | Triggers, conditions, actions, reminders, webhooks    |

## Core product principle

One customer, one continuous story - from website discovery to AI conversation, lead qualification, WhatsApp continuity, Human Action and conversion.

# Reference Platform Architecture

A scalable multi-tenant architecture pattern for the capabilities exposed by CuboidPilot.

|                                    |                                                                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>1. CHANNELS</b>                 | Website Widget • WhatsApp Cloud API • Instagram/Messenger • Email • API/Webhooks                                        |
| <b>2. EDGE &amp; IDENTITY</b>      | Tenant resolution • widget key validation • session/token service • rate limits • authentication • RBAC                 |
| <b>3. CONVERSATION CORE</b>        | Session manager • message timeline • channel router • human takeover state • attachments • delivery status              |
| <b>4. CAI ORCHESTRATION</b>        | Prompt/policy layer • intent engine • retrieval orchestration • tool/action selection • response guardrails • summaries |
| <b>5. KNOWLEDGE / RAG</b>          | Website crawler • documents • FAQs • pricing/catalog • chunking/indexing • metadata filters • citations/grounding       |
| <b>6. BUSINESS SERVICES</b>        | Leads/CRM • pipeline • products/services • payments • appointments • reminders • notifications • analytics              |
| <b>7. WORKFLOW ENGINE</b>          | Trigger → condition → Cai decision → action → delay → channel → human step → outcome                                    |
| <b>8. DATA &amp; OBSERVABILITY</b> | Tenant-isolated operational data • audit trail • event telemetry • analytics • error monitoring • backups               |

Recommended multi-tenant rule: every request, conversation, knowledge item, workflow, lead, payment reference and integration credential should resolve against the authenticated company\_id/tenant context server-side. Public query parameters should never be trusted as authorization boundaries.

Recommended event model: treat important lifecycle changes as events - e.g. conversation.started, intent.high, lead.created, payment.link\_sent, payment.confirmed, human.requested, appointment.booked - so analytics, notifications and automation can subscribe without tightly coupling every module.

# Cai Intelligence & Knowledge Grounding

How to make Cai useful without turning it into a generic chatbot.

The public product describes a Strict Grounding Protocol: Cai should answer from approved business material such as PDFs, pricing sheets, service catalogs and live URLs; if reliable context is missing, the safe behavior is to ask a clarifying question or route to Human Action rather than invent a business fact.

## A strong Cai request cycle can be modeled as:

|                   |                                                                                  |
|-------------------|----------------------------------------------------------------------------------|
| <b>Understand</b> | Detect language, user goal, entity/product, stage and urgency.                   |
| <b>Retrieve</b>   | Fetch tenant-approved knowledge using semantic + metadata filters.               |
| <b>Reason</b>     | Compare retrieved facts with conversation state and workflow rules.              |
| <b>Decide</b>     | Answer, ask, recommend, show a card, call a tool, or escalate.                   |
| <b>Act</b>        | Create lead, book appointment, send payment link, trigger reminder, notify team. |
| <b>Record</b>     | Persist message, decision, source context, action result and outcome telemetry.  |

Knowledge Hub should support versioned sources, source status, last-sync time, access scope, category/tags, product/service relationships, effective dates for pricing/policies, and a preview of what Cai can retrieve. This is especially important when companies change fees, batches, availability or policy frequently.

For product-led conversations, Cai can progressively move from need → recommendation → details → commercial terms → EMI/plan eligibility → payment action → confirmation → recurring reminders, while allowing each company to configure the exact path.

# Workflow Automation Builder

An n8n-style canvas with Intercom-like visual discipline.

The automation layer should let each company define how Cai behaves after specific customer signals rather than relying on one global prompt. The UI can stay minimal and enterprise-focused while the underlying model is node-based.

| <b>Trigger</b>       | New chat, form submitted, high intent, payment confirmed, no reply, date/time, webhook |
|----------------------|----------------------------------------------------------------------------------------|
| <b>Condition</b>     | Course/product, lead score, budget, city, existing customer, payment state, channel    |
| <b>Cai Step</b>      | Ask question, summarize, classify, recommend product, generate personalized response   |
| <b>Content</b>       | Document, brochure, carousel, product/service card, pricing table, FAQ snippet         |
| <b>Action</b>        | Create/update lead, assign owner, send payment link, book appointment, send webhook    |
| <b>Communication</b> | Widget, WhatsApp, email, team inbox notification                                       |
| <b>Control</b>       | Delay, wait for reply, branch, retry, stop, human approval/takeover                    |

## Example enrollment workflow

Visitor asks about Full Stack → Cai identifies experience and goal → recommends course → shows course card → explains fee/EMI → captures lead → sends payment link → payment webhook confirms → enrollment stage updates → monthly reminder workflow starts if applicable.

# Integrations & Action Layer

Connecting Cai to communication, CRM, payments and scheduling.

| <b>Website</b>    | Lightweight JS embed / SDK             | Chat widget, identity, page context, events                     |
|-------------------|----------------------------------------|-----------------------------------------------------------------|
| <b>WhatsApp</b>   | Official Cloud API + webhooks          | Session continuity, follow-up, reminders, human handoff         |
| <b>Payments</b>   | Gateway APIs + signed webhooks         | Payment links, confirmation, invoice/status, reminder lifecycle |
| <b>Calendar</b>   | OAuth / calendar API                   | Availability, booking, reschedule, assigned team notifications  |
| <b>CRM</b>        | Native connector / REST / webhook      | Lead sync, owner, stage, value, notes, activity timeline        |
| <b>Email</b>      | OAuth/API or company-configured sender | Invites, reminders, follow-ups, transactional messages          |
| <b>Automation</b> | REST webhooks / custom actions         | Connect external systems without hard-coding every app          |

The public CuboidPilot site currently presents integrations/channels including WhatsApp, Slack, Stripe, Salesforce, Jira, Shopify, HubSpot, Instagram, Calendar/Calendly, Zoho CRM, Google Sheets, Gmail, Messenger and webhooks. Actual connector availability should be confirmed per plan and production rollout.

# Pricing & Commercial Model

Public pricing displayed by CuboidPilot in October 2026.

| <b>Essential</b>      | ₹79 / seat / month<br>billed annually  | ₹1 / outcome | Individuals, startups and small businesses                      |
|-----------------------|----------------------------------------|--------------|-----------------------------------------------------------------|
| <b>Advanced</b>       | ₹159 / seat / month<br>billed annually | ₹1 / outcome | Growing teams needing workflow automation<br>and assignment     |
| <b>Expert</b>         | ₹279 / seat / month<br>billed annually | ₹1 / outcome | Larger teams requiring collaboration and<br>enterprise controls |
| <b>Cai Standalone</b> | Existing helpdesk                      | ₹1 / outcome | Use Cai with an existing helpdesk                               |

Outcome definition shown publicly: ₹1 per successful AI resolution, qualified lead, or confirmed action; greetings and human escalations are stated as non-chargeable outcomes.

Selected public plan differences: Essential includes messenger, shared inbox/ticketing, reports, public help center and basic automation. Advanced adds workflow automation, multiple team inboxes, round-robin assignment and multilingual/private help center. Expert adds SSO/identity management, SLA capabilities and multibrand messenger/help center.

Commercial terms, taxes, quotas, fair-use limits, startup discounts, add-ons and production connector availability should always be verified against the live pricing page before contracting.

# Security, Isolation & Governance

Controls required for a multi-company AI customer platform.

- Tenant isolation: authorize every database and API operation against the authenticated company context.
- Credential isolation: encrypt WhatsApp, payment, email, OAuth and webhook secrets; never expose them to widget clients.
- Transport & storage: the public site states TLS 1.3 in transit and AES-256 at rest for customer conversations, uploaded documentation and lead records.
- AI data policy: the public site states tenant data is not used to train public foundation models or shared with third parties.
- Role-based access: separate Super Admin, Company Admin, Manager, Agent/Lite and integration-service permissions.
- Auditability: log sensitive changes such as knowledge edits, pricing changes, workflow publishing, exports, assignment and human takeover.
- Webhook security: signed payloads, replay protection, idempotency keys and strict event validation for payment/channel events.
- AI governance: retain source references, confidence/grounding state, escalation reason and action results for traceability.

## Human Action is a safety feature, not just a sales feature.

When knowledge is insufficient, a request is complex, the user explicitly asks for a person, or a business-critical decision needs human judgment, Cai should preserve context and hand the conversation over cleanly.

# Deployment & Implementation Guide

A practical rollout path for a new company tenant.

|  |                                 |                                                                                                      |
|--|---------------------------------|------------------------------------------------------------------------------------------------------|
|  | <b>Create company workspace</b> | Company profile, category, website, admins and brand/widget configuration.                           |
|  | <b>Connect knowledge</b>        | Crawl approved URLs and upload pricing, policies, FAQs, catalogs, brochures and docs.                |
|  | <b>Validate Cai</b>             | Run a test set for common questions, edge cases, pricing accuracy and out-of-scope behavior.         |
|  | <b>Install widget</b>           | Add the CuboidPilot script/SDK to the website and verify tenant mapping and page context.            |
|  | <b>Connect channels</b>         | Configure WhatsApp/other channels and validate webhook delivery plus session continuity.             |
|  | <b>Configure actions</b>        | Products/services, payment gateway, calendar, CRM mapping, email sender and webhooks.                |
|  | <b>Build workflows</b>          | Create trigger-condition-action flows for qualification, handoff, payment and reminders.             |
|  | <b>Set team rules</b>           | Roles, inboxes, assignment, escalation thresholds, SLAs and Human Action policies.                   |
|  | <b>Go live safely</b>           | Start with monitored traffic, review unresolved chats, tune knowledge and publish workflow versions. |
|  | <b>Optimize outcomes</b>        | Track resolution, qualification, handoff, conversion, payment and response quality metrics.          |

# Operating Metrics & 2026 Roadmap Lens

What should be measured as the platform becomes more autonomous.

|                   |                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------|
| <b>AI Quality</b> | Grounded answer rate • unresolved rate • escalation accuracy • correction rate               |
| <b>Support</b>    | First response • AI resolution • human takeover • time to resolution • reopen rate           |
| <b>Sales</b>      | Qualified lead rate • high-intent detection • booking rate • conversion • attributed revenue |
| <b>Payments</b>   | Payment-link CTR • success rate • failed payment recovery • reminder conversion              |
| <b>Automation</b> | Workflow executions • completion rate • error/retry rate • human intervention rate           |
| <b>Knowledge</b>  | Coverage • stale sources • retrieval hit rate • unanswered topics • content freshness        |

A high-value roadmap direction is to evolve Cai from an answer engine into a controlled business action agent: it should understand verified business context, select approved actions, execute them through secure tools, track the result, and know exactly when a human must take over.

## CuboidPilot + Cai

A complete system for AI and human customer action - designed to keep knowledge, conversations, leads, workflows and outcomes connected.
